

## Password processing system for information processor

### Abstract

**PROBLEM TO BE SOLVED:** To completely restore a forgotten genuine password by preparing a password input means, a means which provides in sequence the restoration information units to a user for restoration of the genuine password, etc.

**SOLUTION:** An information processor 1 is connected to a password processor consisting of a password register device 3 which registers an optional password of a user 4, a password input device 5 where the password of the user 4 is inputted, and a collision device 6 which collates an input password with the registered one. Then the processor 1 is started only when a correct password is inputted. When the user 4 uses the processor 1, the password restoration information can be shown on a display 2 based on the registered personal information even when the user 4 forgets his password. Thus, the genuine password is restored based on the restoration information.
